## 7.3 Supremum and infimum.

Let  $A \subseteq \mathbb{R}$ .Let  $c \in \mathbb{R}$ .

- $c$  is upper bound of  $A \Rightarrow$  no values in  $A$  is greater than  $c$ .  $\forall x \in A, x \leq c$ .

- $c$  is least upper bound / supremum of  $A$

 $\Rightarrow c$  is upper bound of  $A$  $\Rightarrow$  if  $b$  is upper bound of  $A \Rightarrow c \leq b$ . $\Rightarrow$  If supremum of  $A$  is in  $A$ , then it is maximum.

- $A$  is bounded above = has at least 1 upper bound.

## 7.4 Supremum &amp; Infimum of Function.

Supremum  $\{f(x) \mid x \in I\}$  $= \sup_{x \in I} f(x)$  = the supremum of its range.

Least Upper Bound Principle (LUB)

- $A$  is bounded above

- $A$  is not empty

 $\Rightarrow$  has a least upper bound.
$$\left( \begin{array}{l} \text{bounded above} \\ = \text{have supremum} \end{array} \right)$$
By substituting the range of a function into  $A$ ,

- If  $f$  is bounded above on  $I$  (not  $\Rightarrow$  has supremum on  $I$ ).

EVT.

- If  $f$  is continuous on  $[a, b]$ ,

 $\Rightarrow f$  has max/min on  $[a, b]$ .

## 7.5 Definition of integral

 $f$  is bounded function on  $[a, b]$ 

"f is integrable" 6 marks.

1. A partition  $P$  of  $[a, b]$  is a FINITE SET of POINTS that include endpoints  $a, b$ .  
(a finite subset  $P \subseteq [a, b]$ ,  $a, b \in P$ .)
2.  $P = \{a = x_0 < x_1 < x_2 < \dots < x_n = b\}$
3. Denote  $m_j = \inf_{x \in [x_{j-1}, x_j]} f(x)$ ,  $M_j = \sup_{x \in [x_{j-1}, x_j]} f(x)$
4. Then  $U_P(f) = \sum_{i=1}^n M_i (x_i - x_{i-1})$ ,  $L_P(f) = \sum_{i=1}^n m_i (x_i - x_{i-1})$ 

$$\left[ \begin{array}{l} \text{for each } i = 1, \dots, n, \\ m_i = \inf \text{ of } f \text{ on } [x_{i-1}, x_i] \\ M_i = \sup \text{ of } f \text{ on } [x_{i-1}, x_i] \\ \Delta x_i = x_i - x_{i-1} \end{array} \right.$$
5. Integrable if
 
$$\inf U_P(f) = \sup L_P(f)$$

$$\int_a^b f(x) dx = \overline{I}_a^b(f) = \underline{I}_a^b(f)$$

► Every lower sum < upper sum.

$$\underline{I}_a^b(f) < \overline{I}_a^b(f).$$

$\Rightarrow f$  is non-integrable on  $[a, b]$ .

$\Rightarrow \int_a^b f(x) dx$  is undefined.

If  $f$  is a continuous on  $[a, b]$

$\Rightarrow f$  is integrable on  $[a, b]$ .

## 7.6. Properties of Lower and Upper sums,

1.  $L_P(f) \leq U_P(f)$ .

2. If  $P \subseteq Q$ .

•  $L_P(f) \leq L_Q(f)$

•  $U_Q(f) \leq U_P(f)$

← more points, closer to actual form

3.  $L_P(f) \leq U_Q(f)$

4.  $L_P(f) \leq L_R(f) \leq U_R(f) \leq U_Q(f)$ ,

where  $P \cup Q = R$ .

7.8.  $g(x) = \begin{cases} 1 & \text{if } x \in \mathbb{Q} \\ 0 & \text{if } x \notin \mathbb{Q} \end{cases}$

inf of  $g$  on any  $[x_{i-1}, x_i] = 0$ .

sup of  $g$  on any  $[x_{i-1}, x_i] = 1$ .

$L_P(f) = 0$   
 $\neq$

$U_P(f) = 1$

$\Rightarrow \int_0^1 g(x) dx$  is undefined.

## 7.9 Integrals as limits,

Let  $P = \{x_0, x_1, x_2, \dots, x_n\}$  be partition of  $[a, b]$ .

For each  $i$ , let  $\Delta x_i = x_i - x_{i-1}$

The norm of  $P$  is

$$\|P\| = \max\{\Delta x_1, \Delta x_2, \dots, \Delta x_n\}$$

$$\star \bullet \underline{I}_a^b(f) = \sup\{L_P(f) \mid P \text{ is a partition of } [a, b]\}$$

$$\star \bullet \underline{I}_a^b(f) = \lim_{\|P\| \rightarrow 0} L_P(f) \quad (\text{i.e., } \max \Delta x_i \rightarrow 0)$$

$$\Rightarrow \forall \varepsilon > 0, \exists \delta > 0 \text{ s.t. } \forall \text{ partition } P \text{ of } [a, b]$$

$$\|P\| < \delta \implies |\underline{I}_a^b(f) - L_P(f)| < \varepsilon$$

Pick sequence of partitions  $P_1, P_2, P_3, \dots$

$$\lim_{n \rightarrow \infty} \|P_n\| = 0$$

e.g.  $P_n$ : break interval  $[a, b]$  into  $n$  subintervals of equal length.

$$\Rightarrow \text{Then } \underline{I}_a^b(f) = \lim_{n \rightarrow \infty} L_{P_n}(f) (= \sup L_P(f))$$

$$\overline{I}_a^b(f) = \lim_{n \rightarrow \infty} U_{P_n}(f) (= \inf U_P(f))$$

## 7.10 Riemann Sums.

• Let  $f$  be bounded function on  $[a, b]$ .

• Let  $P = \{x_0, x_1, \dots, x_n\}$  be partition of  $[a, b]$ .

For each  $i = 1, 2, \dots, n$ ,

- let  $\Delta x_i = x_i - x_{i-1}$

- choose  $x_i^* \in [x_{i-1}, x_i]$

Then

$$S_P^*(f) = \sum_{i=1}^n f(x_i^*) \cdot \Delta x_i$$

• Let  $f$  be bounded interval  $[a, b]$ .

• Assume  $f$  is integrable on  $[a, b]$ .

Proof

$f$  is integrable on  $[a, b]$ .

- Pick sequence of partitions  $P_1, P_2, \dots, P_n$  of  $[a, b]$  s.t.

$$\lim_{n \rightarrow \infty} \|P_n\| = 0$$

- on each subinterval, pick  $x_i^* \in [x_{i-1}, x_i]$  (e.g.  $x_i^* = x_i$ )

Then

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} S_{P_n}^*(f) = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x_i$$

Lower and upper sums

$$\Rightarrow \lim_{n \rightarrow \infty} L_{P_n}(f) = \underline{I}_n^b(f) = \int_a^b f(x) dx$$

$$\Rightarrow \lim_{n \rightarrow \infty} U_{P_n}(f) = \bar{I}_n^b(f) = \int_a^b f(x) dx$$

$$L_{P_n}(f) \leq S_{P_n}^*(f) \leq U_{P_n}(f)$$

$$\text{Squeeze Theorem, } \lim_{n \rightarrow \infty} S_{P_n}^*(f) = \int_a^b f(x) dx$$

Calculate  $\int_0^1 x dx$  using Riemann Sum.

$$\textcircled{1} \begin{cases} f(x) = x \text{ is continuous} \\ \Rightarrow \text{integrable} \\ \therefore \int_0^1 x dx = \lim_{n \rightarrow \infty} S_{P_n}^*(f) \end{cases}$$

$$\textcircled{2} \begin{cases} \text{Choose } P_n = \{0, \frac{1}{n}, \frac{2}{n}, \dots, 1\} \\ \text{(break } [0, 1] \text{ into } n \text{ equal subintervals)} \end{cases}$$

$$\textcircled{3} \begin{cases} \text{Choose right endpoint.} \\ x_i^* = \frac{i}{n} \end{cases}$$

$$S_{P_n}^* = \sum_{i=1}^n \underbrace{\frac{i}{n}}_{f(x_i)} \cdot \underbrace{\frac{1}{n}}_{\Delta x}$$

## 7.11 Five properties of definite integrals

If  $f, g$  are integrable on  $[a, b]$ .

Then  $f+g$  is integrable on  $[a, b]$ .

If  $f$  is integrable on  $[a, b]$  and  $[b, c]$ ,  
Then  $f$  is integrable on  $[a, c]$
