Mean Value Theorem, and APPLICATION! Let  $I$  be an open interval  
 let  $f$  be a function defined on  $I$ .

If  $\forall x \in I, f'(x) = 0$   
 THEN  $f$  is constant.

Rolle's Theorem,

- If.
1.  $f$  is continuous on  $[a, b]$
  2.  $f$  is differentiable on  $(a, b)$
  3.  $f(a) = f(b)$

Then  $\exists c \in (a, b)$  s.t.  
 $f'(c) = 0$

zeros of a function.

If  $f(3) = 0$ , then 3 is zero of  $f$ .

$f''$  1 zero at most

$f'$  2 zeros at most

$f$  3 zeros at most

0.  $3x^2$   $6x$   
 $x^3$   ~~$2x$~~

$x = -3$   $x = 1$
